

WEEK 1: THE DELTA BASELINE TEST

Measurement Before Method

To close the gap, you must first measure it. This session establishes your **Fresh Capacity vs. your Compromised Reality**. You will need a heart rate monitor and a way to track distance (treadmill or GPS).

PHASE 1: THE FRESH CAPACITY (CONTROL)

The Goal: Establish your 1km baseline when fully rested.

Warm-up: 10-minute progressive jog.

The Test: Run 1km at your absolute max effort.

Data Point A: Record your time. This is your 'Zero-Fatigue' pace.

Rest: 5 minutes (full recovery).

PHASE 2: THE COMPROMISED REALITY (THE DELTA)

The Goal: Measure how much your engine drops off when the oxygen is gone.

Perform **3 Rounds** of the following with **NO REST** between movements:

The Spike: 50 Unbroken Air Squats + 20 Burpees (High Intensity).

The Transition: Immediately enter a 1km Run.

The Settle: First 200m is a 'Settle Pace' (focus on breathing), then build to max sustainable speed.

Fresh 1km	Compromised 1km	Your Delta
4:00	4:45	45 Seconds

WHAT YOUR RESULTS MEAN

Delta < 15 Seconds: Elite Engine. Your metabolic clearance is high.

Delta 15–40 Seconds: Intermediate. You have the strength, but your 'Flush' mechanism is inefficient.

Delta > 40 Seconds: Significant Gap. Your brain is pulling the 'Emergency Brake' during transitions.
