

The Delta Zone Baseline: 800m Mirror Test

A baseline test for measuring the efficiency gap between controlled fresh pace and fatigued race pace.

Objective: Measure the athlete's **Efficiency Gap** by comparing a controlled **Fresh Pace** against a **Fatigued Pace** after a maximum-effort metabolic spike. The wider the gap, the more speed the athlete is losing once the engine is hot.

1 The Fresh Pace (The Control)

- Distance: 800m run
- Instruction: Run at a 7/10 effort - strong and sustainable, not an all-out sprint
- Data: Record your exact time (example: 3:15)

2 The Delta Trigger (The Workout)

- 4 rounds at RPE 10 (maximum effort)
- 15 Wall Balls (20 lb / 14 lb)
- 10 Burpees
- 200m Sprint
- Goal: total redline to create maximum physiological noise and leg fatigue

3 The Delta Zone Movement (The Re-Test)

- Distance: 800m run
- Instruction: Immediately return to the run
- Goal: Match your Phase 1 time as closely as possible

The Delta = the difference, in seconds, between your **Fresh Pace** (Phase 1) and your **Fatigued Pace** (Phase 3).

Scoring Your Delta

Variance (Seconds)	Status	Analysis
0 - 10	Engine Locked	Your Delta is minimal. You have elite recovery and movement efficiency under extreme stress.
11 - 25	The Growth Zone	Standard Delta. Your engine is strong, but you are leaking energy once the heart rate redlines.
26+	The Leak	Your Delta is too wide. Your mechanics or aerobic stability are collapsing; you need to stabilize the mid-range.

The Philosophy

"The 200m sprints and burpees create the noise. The final 800m reveals the truth. In the Delta Zone, we do not just care how fast you can go when you are fresh - we care how much of that speed you can keep when the engine is hot."

BUILD THE ENGINE. MINIMIZE THE GAP.
