

DELTA ZONE ENDURANCE BUILDER

1-Week Starter Program

This short endurance program introduces athletes to the Delta Zone training approach. The goal is to build aerobic capacity while exposing the athlete to controlled fatigue and pace changes. These workouts improve an athlete's ability to maintain movement under stress while developing efficient running mechanics.

Perform the workouts on three non-consecutive days during the week. Example schedule: Monday, Wednesday, Friday.

Day 1 - Pace Control Intervals

This session teaches athletes how to move between low-intensity recovery and higher-intensity running without losing rhythm.

Workout
800m Run - RPE 4
200m Power Walk
600m Run - RPE 8
200m Light Jog

Focus: control your breathing during the first run, push pace during the 600m effort, and recover while still moving.

Day 2 - Engine Builder Circuit

This workout builds endurance while forcing your body to adapt to different machines and movement patterns.

Workout
4 Minute Row - RPE 6
1 Minute Rest
4 Minute Ski - RPE 4
4 Minute Run - RPE 6
2 Minute Row - RPE 10
1 Minute Rest
2 Minute Ski - RPE 10
Immediately into 400m Run - RPE 6

Focus: maintain strong breathing rhythm, control pace early, and push intensity during the final row and ski efforts without losing movement quality.

Day 3 - Endurance Benchmark

Workout
3K Run - Timed for Best Effort

Run at your best sustainable pace and record your finish time. This becomes your baseline benchmark for future training.

Weekly Goal

This program is designed to help athletes build aerobic endurance, improve recovery while moving, develop pacing awareness, and increase work capacity. Repeat the program weekly while trying to slightly improve your Day 3 benchmark time.

Instructions To Move Forward

Use this 1-week endurance block as your entry point. Complete all three sessions, record your 3K benchmark time, and note where your breathing or pace begins to break down.

Once you finish this free week, the next step is to move into the Delta Zone System and begin training the gap between your fresh pace and your fatigued pace.

From here, athletes should move into the full Delta Zone program to build transition efficiency, compromised running control, and stronger race-day endurance under fatigue.

Next Step
